COMMIPHEROLINE, THE PLUMPING ACTIVE INGREDIENT

Commipheroline is extracted from the root of an Indian tree well-known in Ayurvedic medicine: *Commiphora mukul*. It presents a repulping effect with two main applications: wrinkle filling and breast enlargement.

AN ANTI-WRINKLE ACTIVE

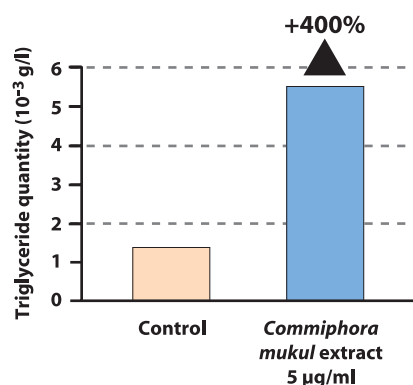

Skin aging leads to alterations of the skin mechanical properties. The adipose tissue reduction, coupled with the degradation of the extracellular matrix components make the face skin thinner and thinner. Commipheroline helps to maintain the skin tone by acting on two enzymes committed in lipogenesis and in lipolysis chain reactions.

Increase of triglyceride level in adipocyte (*in vitro* Test)

Triglyceride level in adipocytes increases thanks to G3PDH activation and AMPc production inhibition. Triglyceride level is assayed 11 days after treatment.

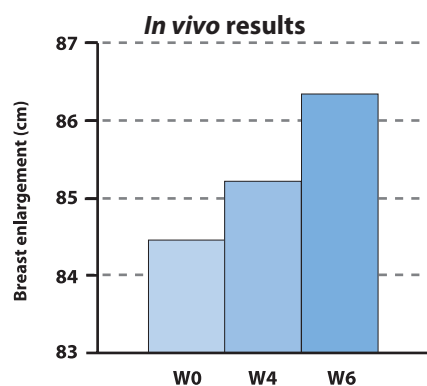

By increasing triglyceride level,
Commipheroline helps to fill up wrinkles

A BREAST ENLARGEMENT ACTIVE

By increasing adipocyte volume, Commipheroline repulps the breast. Commipheroline 1% in a cream is tested by 10 female volunteers 18-43 years old once a day. The breast is measured at week 4 and week 6 (cm test).

Commipheroline leads to a
2 - 4 cm breast enlargement

- 80% of the panel considered an important breast enlargement
- 70% of the panel saw an improvement of the skin quality
