

ANTI-WRINKLE

SKIN CARE PATCHES-ARGIRELINE

A real alternative to injection & reduce the depth of wrinkle without injection

ARGIRELINE:

Argireline, synthetic peptide (Acetyl Hexapeptide-3) that can produce its effect through the same mechanism as that used by Botox. Hence, the nerve/muscle stimulation at the presynaptic membrane is inhibited and muscle contractions are attenuated, preventing the formation of lines and wrinkles.

- In vitro tests have confirmed the protein binding as well as the inhibition of muscle activity.
- In vivo tests, the depth of wrinkles was significantly reduced after 30 days' applications.

SKIN CARE PATCHES

Skin care Patch, one of new delivery systems that can be used, in a broad spectrum of cosmetic applications. Skin care patch helps to maximize the desired results by ensuring that all cosmetic active ingredients are penetrated into the skin and delivered to the right place at the right moment. These patches are ideally suited for skin care treatments. Two types of matrixes of patches were developed for different applications.

- Hydrophilic matrix containing hydrogel for short time application (15-30 min).
- Lipophilic matrix containing hydrocolloids for long time application (over night).

SKIN CARE PATCHES with ARGIRELINE:

Two types of skin care patches containing Argireline together with vitamins and plant extracts in order *to enhance the penetration and to decrease wrinkles immediately without injection.*

- **Dp-RFAHP2k** : hydrophilic patch (15-30mins. application) containing Argireline, Vitamins E & C and Plants extracts
- **Dp-VitAHP2k** : lipophilic patch (at least 6hr applications) containing Argireline and Glycosphere-vitamin C & complex of Vitamin A, E, and F.
